

Depression – Looking on the Bright Side And How It Might Be Found

Author: Tracey Williams CFNC - July 2026

AI Assisted Cross-Reference Checked: Ezra Darash

Depression... It's Personal

Snow, cold, and dreary day -- GO AWAY!

Ms. Tracey wants to go out and play!

Depression... Oh it can be very personal! On this late Oklahoman January day, the weekend of 23 January 2026, we had about 4–5 inches of snow, and daytime temperatures in the teens with no sunbeams to be seen. And to make matters worse, the weather reports show a whole weekend of this mess... I feel trapped...melancholy.

Oh yeah, depression is setting in! (This has not happened in a long time.) I prepped as best I could, went shopping to get necessities to carry me through this storm, checked on my animals, covered faucets, drained pipes and dripped water as needed. I also had the furnaces checked and my backup generator is ready for any power outages. Physically... I am prepared as best as possible; however, mentally, it is another story!

Mentally... I want to stay in my PJs and hibernate in bed like a bear waiting for winter to pass. You see, I grew up in the Poconos of Pennsylvania and then lived in Northern Virginia, and yes, I hear it a lot (too much actually), *“Being from the North East, you should be used to it!”*. Well, NO!!! I could not stand those cold, snowy days as a child and young adult. I am a Spring and Summer child. I love the warmth of the sun, soft breezes blowing, and the beauty of colourful flowers, green leaves on trees, fresh fruit ready for harvest, and light gentle rain followed by a brilliant sun peeking through clouds, producing God’s artistry, splendor, and promise ablaze in a prismatic rainbow! Whenever I see a rainbow, I think of Genesis 9:13-17 after the Great Flood, God set the rainbow in the clouds as a token of an everlasting covenant between Himself and all living creatures, promising never again to destroy all flesh with a flood. The rainbow serves as a divine reminder of this merciful pledge to preserve the earth for all future generations. How beautiful! How divine!

Oh! But the depression...As a young adult, depression was a part of my life from roughly Labor Day through St. Patrick’s Day and I hid it well from others. I really noticed the change in the length of the days. I ‘felt’ each day getting extremely short in the Fall and of course getting longer after the Winter Solstice. However, the time change in the Fall (You know that *“Fall back”* ritual most the United States does?) made matters even worse. With that one-hour time change, came what felt like weeks-on-end where I never saw the sun except briefly through a window! You see, getting up early, driving to work in the dark to beat traffic and make it on time for those early meetings, and then travelling home around 5pm to only see the last rays of the sun as it set in the west was a depression I dealt with secretly at that time. It was only later that I learned that this depression was real, others had it also, and it is called Seasonal

Affective Disorder (SAD), sometimes called “*winter depression*” or the “*winter blues*”. I later had some counselling, but the depression never quite went away, at least not until I moved to Texas. You see, I was finally done dealing with so, so much long, cold, snowy, dreary weather. I had to change my circumstances; though this is not the normal way! I had the opportunity to move further south and to a different time zone. This move helped me a lot, which paved the way for what ‘felt’ like longer days and, of course less wintery weather; therefore, mentally, less SADs symptoms or “seasonal” episodes. However, I still had to address my depression from a Functional Nutrition perspective... continue reading to learn this approach. I promise a Functional Nutrition approach helps not only your depression symptoms, but also helps your WHOLE body feel better, and most importantly help you to feel more Joy and Happiness in your life!!

What is Depression?

Depression is a serious mood disorder causing persistent sadness and loss of interest, affecting how you feel, think, and act and leading to various emotional and physical problems.

Depression is a whole-body illness - involving the body, nervous system, affecting our behavior, mood, thoughts. It affects the way you eat and even sleep, your self-esteem, and the way you interact with others and the environment around you. (7) Pastor Dr. David Jeramiah describes depression as more than the ‘*case of the blues*’ – i.e. it is not just a bad day. Depression takes over your body. It is ‘*embodied emotional suffering*’ that affects our physical being as well as the emotional. Depression is the leading cause of disability worldwide; no gender, age group, or other demographic group is immune from depression. (8) According to a 2023 American Psychiatric Association survey, 29% of adults have been diagnosed with depression at some time in their lives; approximately 18% currently live with depression. (1)

So how much depression goes undiagnosed and not properly treated? Well, determining the exact number of undiagnosed depression is difficult because this data is not captured in medical records. The World Health Organization (WHO) estimates that world-wide approximately two-thirds of mental illness goes untreated with many being undiagnosed. Worldwide, more than 10% of pregnant women and women who have just given birth experience postpartum depression. (2) According to Steven Lamm MD, medical director of the Preston Robert Tisch Center for Men’s Health at NYU Langone Medical Center, “Primary care physicians miss depression in men more than 50% of the time,” often because men may express symptoms differently or view the condition as a weakness. (3) While roughly 25% of older adults experience mental health issues such as depression, two-thirds do not receive proper treatment, as it is often mistaken for a normal part of aging or manifesting as physical aches and memory issues rather than sadness. (4) An overwhelming 60% or more of American youth with major depression do not receive mental health treatment either, which often stems from initial lack of diagnosis, with many of the youth believing they can handle it on their own. These high rates of missed diagnoses are primarily attributed to stigma, lack of access to care, and symptoms being missed by primary care providers.

According to Dr. James Balch, “The causes of depression are not fully understood, but they are probably many and varied. Depression may be triggered by tension, stress, a traumatic life

Basic Biblical NUTRITION

My Momma Never Told Me...

Practical health topics with a little Southern hospitality and a lot of science clarity – Plain & Simple.

event, chemical imbalances in the brain, thyroid disorders, upset stomach, headache, nutritional deficiencies, poor diet, the consumption of sugar, mononucleosis, lack of exercise, endometriosis, any serious physical disorder, or allergies”, hypoglycemia (low blood sugar) and/or can be hereditary. An interesting note here is, according to Dr. Balch, food allergies are one of the most common triggers of depression. (7) Depression can happen at any time in our lives, from late teens to mature adults in their “Golden Years” with more women than men being diagnosed with some form of clinical depression. Keep in mind it is normal to experience moments of depression or the ‘blues.’ However, if depression symptoms last more than a few days and affect daily life such as school, work, relationships and social interests a medical diagnosis of depression may be required.

Some **common symptoms** of depression include:

- **Emotional:** Persistent sadness, anxious or "empty" mood; loss of interest/pleasure; irritability; feelings of worthlessness or guilt.
- **Physical:** Fatigue, decreased energy; sleep changes (too much/little); appetite/weight changes; unexplained aches/pains.
- **Cognitive:** Difficulty concentrating, remembering, or making decisions; negative thinking; thoughts of death or suicide.
- **Behavioral:** Social withdrawal; slowed movements or speech; restlessness; inability to enjoy hobbies.

The most **common types** of depression include:

- **Major Depressive Disorder (MDD):** The most common form, characterized by severe symptoms that interfere with daily life.
- **Persistent Depressive Disorder (Dysthymia):** A long-lasting (2+ years) low mood, less severe than MDD.
- **Postpartum Depression:** Depression after childbirth.
- **Seasonal Affective Disorder (SAD):** Depression related to seasonal changes.
- **Psychotic Depression:** Severe depression with psychotic features like hallucinations or delusions.

What Does God Say?

In the Old Testament, several of God’s faithful people suffered depression. For example, King David lamented:

“How long wilt thou forget me, O LORD? Forever? how long wilt thou hide thy face from me?”

How long shall I take counsel in my soul, having sorrow in my heart daily? how long shall mine enemy be exalted over me?” Psalm 13:1-2 (KJV)

In Jeremiah 20: 14-18 (KJV), Jeremiah lamented after being beaten by a priest of Israel for boldly declaring the Word of the Lord. He curses the day of his birth; he wishes he had died in the

Basic Biblical NUTRITION

My Momma Never Told Me...

Practical health topics with a little Southern hospitality and a lot of science clarity – Plain & Simple.

womb because as a prophet he felt shame, sorrow, and derision, making life a burden of constant struggle and disgrace. It is a deep expression of his anguish over God's overwhelming commission. The prophet Jeremiah also expresses overwhelming grief and deep distress over Judah's turning towards idols and their unfaithfulness to God. Also, Jeremiah mirrors deep empathy of God's own heartbreak, and feels an emotional toll of the inevitable coming judgment on God's people in Jeremiah 8:18 (KJV):

"When I would comfort myself against sorrow, my heart is faint in me." Jer 8:18 (KJV)

Remember you are not alone; God is with us (Emmanuel) MT 1:23! People who struggle with mental illness frequently feel isolated and alone. However, God is with each and every one of us in our suffering and in our good health. Try to keep this in mind when you get depressed (I do! And it helps a lot!), biblical heroes like King David, the prophet Jeremiah, Job, and Elijah all of whom battled depression and God's love never faltered through it all. So, when you feel depressed, consider yourself in the company of some of the greatest people who ever lived! Wow! Ponder that!!

From a Biblical perspective, how should we respond? In Psalm 46:1 (KJV) it says we are to call out to God who is "is our refuge and strength, a very present help in trouble". So, let's call out to God for His divine help and, while doing so, concentrate on honouring God with our bodies and our minds; by being mindful, eating healthy, and enjoying the life God has given us! For it is written:

*"What? know ye not that your body is the temple of the Holy Ghost which is in you, which ye have of God, and ye are not your own?
For ye are bought with a price: therefore, glorify God in your body, and in your spirit, which are God's."* 1 Cor 6:19-20 (KJV)

"Whether therefore ye eat, or drink, or whatsoever ye do, do all to the glory of God."
1 Cor 10:31 (KJV)

The Functional Nutrition Approach:

When looking at depression through a Functional Nutrition lens, in general, we want to look at diet and lifestyle. We are curious and ask: *"What is going on in there?"* and *"Why?"*. In other words, the focus is not simply on the diagnosis but also asking, "What underlying imbalances may be contributing to the depression in the first place?" In order to do this, we need to 'get back to the basics.' *(You may ask, "But what does this entail?")*

One way Functional Nutrition approaches this is through the concept of **3 Roots, Many Branches**. Depression, which is considered to be a chronic condition whether diagnosed or undiagnosed, is one of the many *branches*—the signs, symptoms, and diagnoses we see. The goal is to look beneath the surface and address the three *roots*: **Genes, Digestion, and Inflammation**. *(Oh dear...what do my tight jeans, digestive bloating, and inflammation have to*

Basic Biblical NUTRITION

My Momma Never Told Me...

Practical health topics with a little Southern hospitality and a lot of science clarity – Plain & Simple.

*do with depression? Sorry, girlfriend...y'all are talking about the wrong kind of **genes**! Keep reading.)*

Genes – looking at how our genes interact with our **Environment, Movement, Mindset, and Food** we eat.

Digestion – where "food meets physiology," including the **Mechanical, Chemical, Structural, and Microbial** aspects of digestion.

Inflammation – supporting the immune system by **Clearing, Calming, Enhancing, and Modulating** inflammation.

There is another important part of this picture. In the **3 Roots, Many Branches** paradigm, we must also address the Soil, where the Roots live to affect the Terrain, because this is where depression takes root and grows. The terrain is simply the body's internal environment—the biological environment in which a person's dis-ease takes root and grows. According to Andrea Nakayama founder of Functional Nutrition Alliance, we need to address the '*soil that impacts all health conditions. Signs, symptoms, and diagnoses exist in the "terrain" of dysfunction that is impacted by a myriad of factors.*' It is the recognition that one chronic condition, such as depression, most likely has multiple underlying causes and a personalized approach is required to target ALL of the root causes for resolution to occur. Remember, "One size does not fit all" and there is no "quick fix"! We need to keep in mind the mantra:

**Everything is connected,
We are all unique,
All things matter.**

Getting 'Back to the Basics': You are probably asking: "How do I do this?" The simple answer is: 1) drinking plenty of water, 2) eating **real** whole foods, and 3) making the appropriate lifestyle changes.

(Huh??? Do what? I can't do all that! I am comfortable in my current lifestyle!) Please keep in mind, no one is asking you to do all of this at once. Start low, go slow, and give yourself some grace along the way. *(Think of God's grace here and thank Him for His help in accomplishing the steps you are taking!)* When approaching dietary and lifestyle changes.

For example, consider a baby. A newborn is very dependent on adults to take care of, nurture and help them. However, as the baby grows, they learn to lift their body, begin crawling, then standing, walking, and running; doing all this with the help and love of the adults around them. The adults surrounding, helping and nurturing this baby through these early stages of life are the baby's community, connection to others, and network! The baby in this analogy, if you have not surmised yet, is the person wanting to make the necessary diet and lifestyle changes.

Basic Biblical NUTRITION

My Momma Never Told Me...

Practical health topics with a little Southern hospitality and a lot of science clarity – Plain & Simple.

Remember, one size does **NOT** fit all. Take those baby steps and make changes at a pace that works for you.

So, we need to answer the question, *“What are the diet and lifestyle factors that can be modified to help mood, anxiety, and depression?”* (NOTE: The list below is the cliff notes version. A deeper dive into all these lifestyle modifications will follow in the future.):

- 1) Drink plenty of water, balanced with electrolytes: The amount of water to drink varies with one's activity level, diet, age, overall health, environment, and whether pregnant or breast-feeding. To get a rough calculation, divide your body weight in pounds by two to obtain the amount of water in ounces you should aim to drink per day. If you eat a lot of fruits and vegetables with a high-water content you will need less water, on the other hand, foods high in fiber will require more water, as fibrous food absorb water.

(You may be asking, “What are Electrolytes?” Let me tell you...) Electrolytes are electrically charged minerals—including sodium, potassium, calcium, magnesium, chloride, phosphate, and bicarbonate—essential for regulating nerve/muscle function, hydration, pH balance, and blood pressure. They can be found in many of the clean, healthy foods we eat, and as powdered or liquid supplementation for drinking when mixed with water.

- 2) Get enough sleep: The average adult needs 7 – 9 hours of quality sleep per night. The keys to help with falling sleeping and staying asleep include; 1) take the time to ‘*rest and digest*’ after meals (preferably finishing your last meal at least 2-3 hours before bedtime, 2) relaxing and calming down your body and mind at least an hour before going to bed, 3) sleeping in a room that is cool, dark (ideally, pitch-black), quiet (or if needed, have a fan to going for a little ‘white noise’), and void of ALL electronics displays on (especially, blue light emissions!). And yes, even the cellphone, TV, and the clock radio! Remember, this room IS your sanctuary! Another suggestion is to determine your natural circadian rhythm by going to bed by 10 or 10:30pm, when cortisol levels are decreasing, and keeping a regular bedtime schedule. (10)
- 3) *(If you can)* Go outside, breathe the fresh air, feel the sunshine on your face, and move around!! Simply feeling the sun on your face and inhaling fresh air elevates mood. Sunshine boosts mood by increasing brain chemicals such as the “happy chemical” serotonin, and dopamine, which promotes feelings of calm, happiness and focus. *(Honey, every time I step outside into the sunshine, I can hear John Denver singing, “Sunshine on my shoulders makes me happy.”)* Sunshine also helps regulate your circadian rhythm and boosting Vitamin D3 production, all vital to mental health. It is recommended to get 10-30 minutes midday sun (depending on skin type, the more melanin in the skin the more time needed) provides adequate production of Vitamin D3 in your body. (5) In short, Vitamin D3 production begins

Basic Biblical NUTRITION

My Momma Never Told Me...

Practical health topics with a little Southern hospitality and a lot of science clarity – Plain & Simple.

when 7-dehydrocholesterol in the skin reacts with UVB radiation from the sunlight with further support from the liver and kidneys. (NOTE: Remember to apply sunscreen to protect the skin from sun damage.) A lack of sunlight is known to cause mood swings, fatigue and can lead to Seasonal Affective Disorder (SAD).

- 4) Keep Your Body and Mind Active: Studies have shown that any kind of exercise such as swimming, biking, walking or any activity you enjoy doing is important in addressing depression. (7) Keeping the mind active is also important whether by participating in creative activities, stimulating the frontal cortex with puzzles and games, and/or performing consistent routines to create a sense of purpose and reducing cognitive load. Remember, the key is to do activities you enjoy.
- 5) Maintain relationships and networks/connections: One type of connection is massage therapy. According to Reader's Digest publication, "Having a massage makes a person feel cared for and comforted. It can stimulate the body's innate healing abilities by improving circulation and cleansing the body of toxins." "The ideal: create a pleasant environment and surround yourself with positive, understanding people." (6)
- 6) Manage Stress: Daily prayer, meditation, and/or regular yoga/stretching sessions can improve self-esteem, as well as regulate and tone the body. Breath exercises, that is rhythmic and intentional breathing helps reduce stress. (6) A lack of adequate, restful sleep is one of the biggest stressors on the body's homeostasis. In fact, it affects the immune system by suppressing Natural Killer (NK) cell activity. *(Oh Girl! We will talk more about dem tough NK boys soon. So read on...)*
- 7) Digestive Health and Diet: *(Oh yeahhh...just like Fred Sanford would say... "Oh, this is the BIG ONE!" Fred may have been faking a heart attack... Were not. We will dive into digestive health instead!!)* Adopt a nutrient-rich and anti-inflammatory diet, emphasizing REAL fruits & vegetables, whole grains, seeds, nuts, healthy fats (such as olive oil, wild caught fish), and proteins (whether plant-based or high quality, non-GMO, grass-fed meats and eggs). Eliminate processed foods, such as refined and artificial sugars, processed grains (such as enriched flour), and any processed snacks and fast foods, as they are all associated with higher risks of depression, as well as other health conditions. At every meal and snack, it is recommended to eat a healthy Fat, Fiber and a Protein. Also, get that blood sugar under control!

At first glance, this may seem overwhelming... The best approach is to determine a routine that works for your lifestyle and that you enjoy doing. This IS really, really important and it will help you stick to a plan (your plan). Go low and go slow, taking baby steps to incorporate these diet and lifestyle changes, and give yourself some grace when you find yourself in a situation, such

as a friend's birthday party or dinner out at your favourite restaurant, where you cannot make all the healthy choices you want to make.

The “Gut of the Matter” with Depression

(So, let's get to the 'gut of the matter'... your gut!) The health of the gut is CORE to good health! Period!! *Did you know?* Digestion is the BIGGEST stressor we place on our bodies every day! Besides food breakdown, the digestive system plays a key role in immunity and neurology. Therefore, the brain-gut axis needs to be addressed (some references include the microbiota as part of this axis; i.e. it can be referred to as the brain-gut-microbiota axis). A healthy digestive tract doesn't just digest food—it also influences the immune system, inflammation, hormone production, and even the brain chemicals involved in mood.

Our gut is like THE doorway to the body. If all is well within the gut, generally speaking, life should be good within the body. Our gut talks to our brain through the brain-gut axis and vice versa. In regards to depression, our gut, especially a ‘Leaky Gut’, can cause mental health challenges. We begin by looking at digestive health to determine if there is a problem with our digestive system, as it is vital to addressing brain health and thus depression.

What is a ‘Leaky Gut’? Intestinal permeability, also known as ‘Leaky Gut’, is when there is an increased permeability of the intestinal mucosa, allowing bacteria, toxins and small molecules to cross the intestinal barrier and ‘leak’ into the bloodstream.

Open Your Mouth, Insert Food, AND Don't Forget To CHEW A Lot! So, let's start at the beginning of the digestive tract—the mouth. Yes, that's right...the mouth! Digestion begins here, not in the stomach.

(Did you know mindful chewing is the key to unlocking the power of digestion?) Mindful chewing gives your digestive system the best possible start. It helps your body break down food so it can absorb the nutrients God designed that food to provide. Andrea Nakayama states in a class, “we're not just what we eat, but what our bodies can do with what we eat.”

When we don't chew our food well, the rest of the digestive system has to work much harder. Over time, poor digestion can affect how well we absorb nutrients, and if the body isn't getting the nutrients it needs, every system in the body can be affected—including the brain. We'll explore that amazing gut-brain connection a little later.

What we eat—or don't eat—is key to a healthy gut. Just as important is having a digestive system that can properly break down and absorb those nutrients. When the lining of the gut becomes damaged and inflamed, nutrient absorption suffers, no matter how healthy the diet may be. Since nearly 70% of our immune system is associated with the gut, poor gut health can also affect immune function and increase inflammation throughout the body. Scientists now know this inflammation can influence the production of important brain chemicals, such as

Basic Biblical NUTRITION

My Momma Never Told Me...

Practical health topics with a little Southern hospitality and a lot of science clarity – Plain & Simple.

serotonin and dopamine, helping to explain why poor gut health has been linked to symptoms like brain fog, fatigue, anxiety, headaches, and even depression.

It's the Transmission... The 'Neuro Transmission'!

Food greatly influences brain behavior too. A diet high in processed foods, refined sugar, fast foods, and other highly processed, non-whole foods can contribute to depression. *"How so?"*, you may ask. Remember, *"we are not just what we eat, but what our bodies can do with what we eat."* Neurotransmitters carry impulses between nerve cells. The levels of these neurotransmitters, the chemical messengers that help regulate mood, rely on the nutrients our bodies receive from the foods we eat. Neurotransmitters most associated with mood are serotonin, dopamine, and norepinephrine (7) and beta-endorphins.

Beta-endorphins, Serotonin, Dopamine, and Norepinephrine – What are they and Why Should we care?

Beta-endorphins are the brain's natural painkillers and help us cope with stress while promoting emotional well-being. When levels are low, people may feel emotionally overwhelmed, inadequate, or "stuck." **Serotonin**, often called the "feel good" neurotransmitter, helps regulate mood, sleep, digestion, and feelings of calm. Low serotonin levels have been linked to anxiety, insomnia, digestive issues, and depression.

Dopamine is the brain's reward and motivation neurotransmitter. When dopamine levels are low, people often experience low motivation, poor concentration, low energy, sadness, and a reduced ability to experience pleasure—all common symptoms of depression. **Norepinephrine** helps regulate alertness, attention, focus, and the body's response to stress. When levels become imbalanced, people may experience fatigue, difficulty concentrating, and low mood.

What about 'Healthy Stress'? Is There Such A Thing? In the sermon *"Choosing Relaxation Over Stress (Part 1)"*, Pastor Robert Jeffress suggests living above your problems, where choosing your attitudes can change your life. Studies show that some stress, that is 'healthy stress' is good for us – It can strengthen us and enhance the immune system. Short bursts of stress cause the pituitary gland in the brain to release *beta-endorphins*, helping the immune system and in particular the Natural Killer (NK) cells. (9)

According to Dr. John Mley, a professor of Geriatrics at St. Lewis University School of Medicine, the stress you can adequately cope with may actually be good for you. However, long bouts of stress are harmful because they raise the body's cortisol levels, which can contribute to chronic depression. (9)

The Natural Killer Cells – What A Cool Name!! But What Are They? Let's talk about those stealthy *tough boys*... The Natural Killer (NK) cells can be considered the 'special forces' of our immune system. They quickly recognize and destroy virus-infected and abnormal cells without needing prior exposure. Keeping these cells healthy and functioning at peak performance is one more reason why good nutrition matters. The immune system is extremely sensitive to our nutritional status. "Simply put, optimal immunity requires optimal nutrition!" (10)

Now For The GOOD News! This is the cool part...with proper diet and lifestyle changes, most organs, including the brain and the intestine CAN be repaired. But this does not mean we can

Basic Biblical NUTRITION

My Momma Never Told Me...

Practical health topics with a little Southern hospitality and a lot of science clarity – Plain & Simple.

work to repair the intestinal lining with good nutrition and expect to go back to our Standard American Diet (SAD), only to damage it again! Through consistent diet and lifestyle changes, the immune system can be strengthened and healthy neurotransmitter levels restored. However, there is no quick fix... no single food or supplement will fix years of unhealthy eating. It is only through choosing lifestyle and diet change that we can reverse the damage caused by years of unhealthy living.

According to Trudy Scott, CN, a certified nutritionist and author of *The Anti-Anxiety Food Solution*, digestion and blood sugar are first and foremost to be addressed because we often see significant improvement before more targeted interventions are needed. Trudy recommends adding in real whole foods as they are going to provide all the co-factors for making the neurotransmitters. Key nutrients for proper brain health include: omega-3, the B vitamins (particularly folate, and B12), choline, iron, zinc, and magnesium. Iron, zinc, and magnesium are key factors for making our neurotransmitters. (11)

Concluding Remarks

Rebuilding the gut, immune, and brain health requires a synergistic approach focusing on diet, lifestyle, and stress reduction to foster a healthy digestive tract. Key strategies include:

- eating a nutrient-dense diet rich in fruits, vegetables, and lean proteins and fermented foods;
- ditching the refined sugars and processed foods;
- drinking plenty of water;
- getting 7–9 hours of quality sleep;
- going outside, soak up some sun and breathe in fresh air;
- managing chronic stress to reduce inflammation and support the gut-brain axis;
- exercising moderately;
- maintaining relationships and
- avoiding smoking/vaping and excessive alcohol.

Throughout all these lifestyle and diet changes, remember to take it slow...to take those baby steps and give yourself some grace when things do not go as planned. Remember, depression is not simply a problem of the mind. It involves the whole person—body, brain, gut, immune system, lifestyle, and spirit. By addressing these together, we honor the amazing way God designed us to heal. With consistency, this approach will help your WHOLE body feel better. You will feel more Joy and Happiness in your life, which in turn will alleviate some if not all depressive symptoms. So, call out to God for His divine help and, while doing so, think about
